- [Download Client Connection Details](#)

# Download Client Connection Details

## Torrent Clients

- In **Search Settings** to add a Torrent download client click on the **Torrent Search** tab.

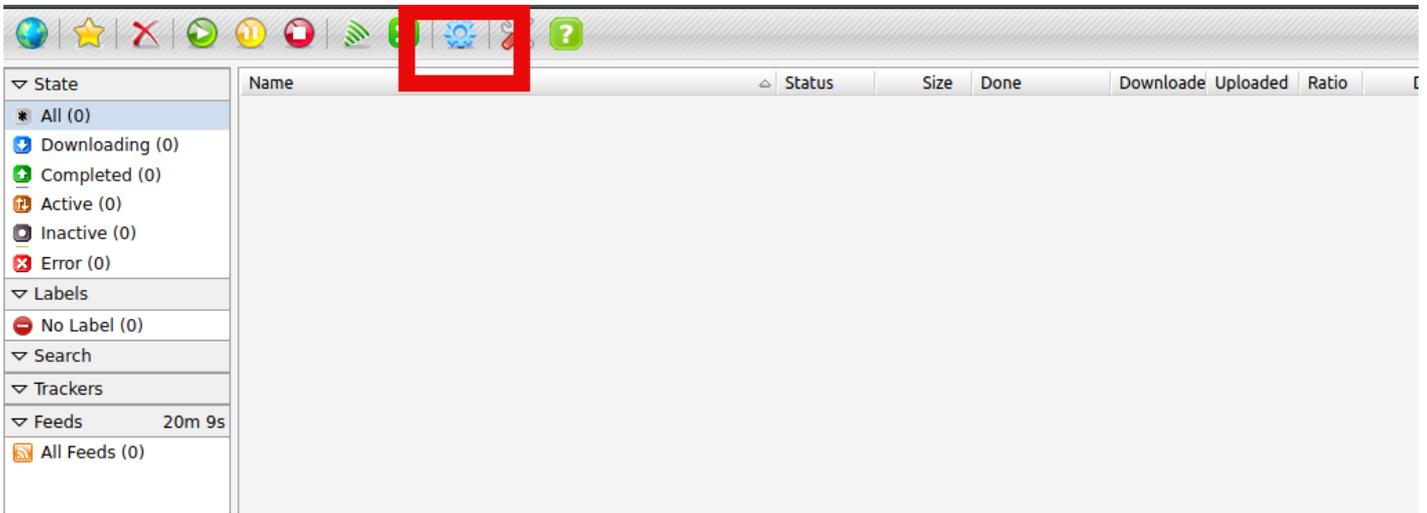

## rTorrent

### Connection Settings

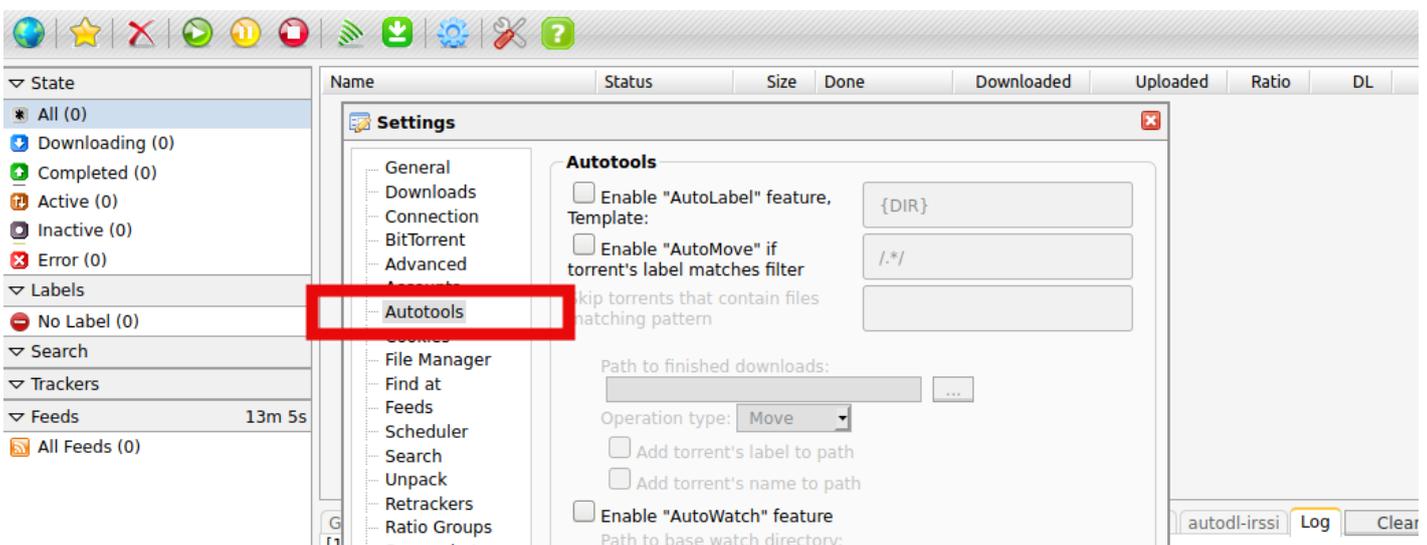

```
Search .torrent files: ENABLED
Send .torrent files to: rtorrent
rTorrent host: port:
https://{username}. {servername}. usbx. me/rutorrent/plugins/httprpc/action. php
Http Authentication: Basic
rTorrent Username: {username}
rTorrent Password: As configured in UCP under ruTorrent
Add Label To Torrent: Medusa
Downloaded Files Location: <EMPTY>
```

### Post-Processing Setup

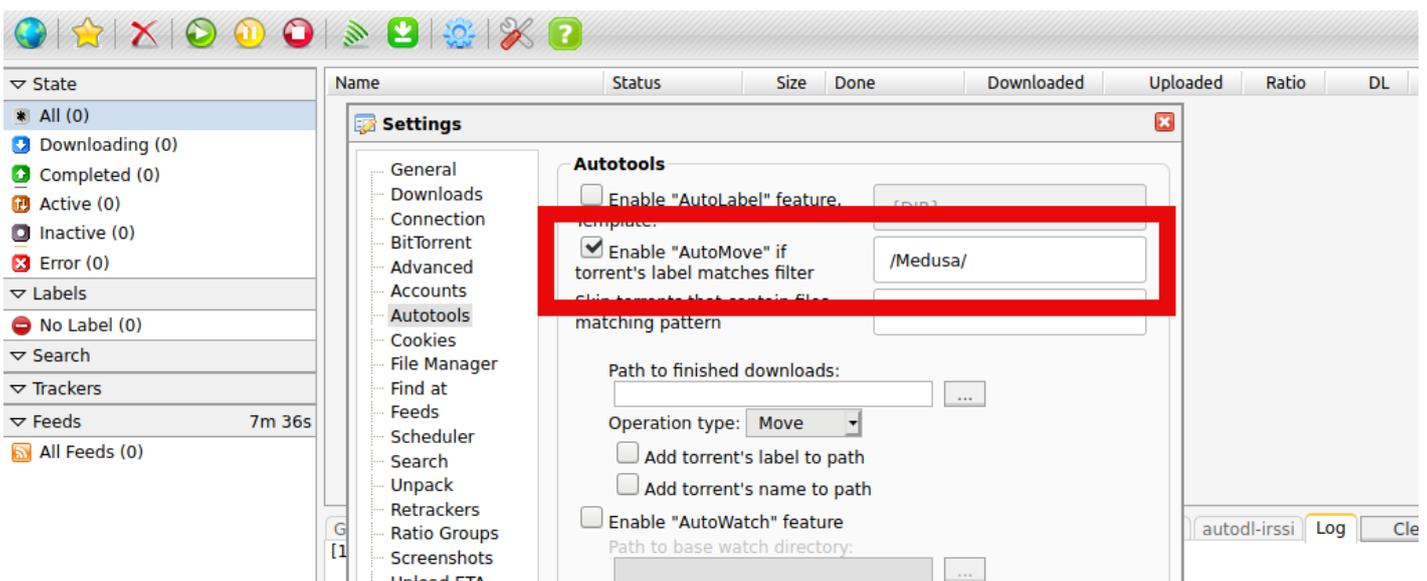

- Access and login to your ruTorrent instance using the credentials you set during installation
- Go to **Settings** by clicking the **Gear Icon**

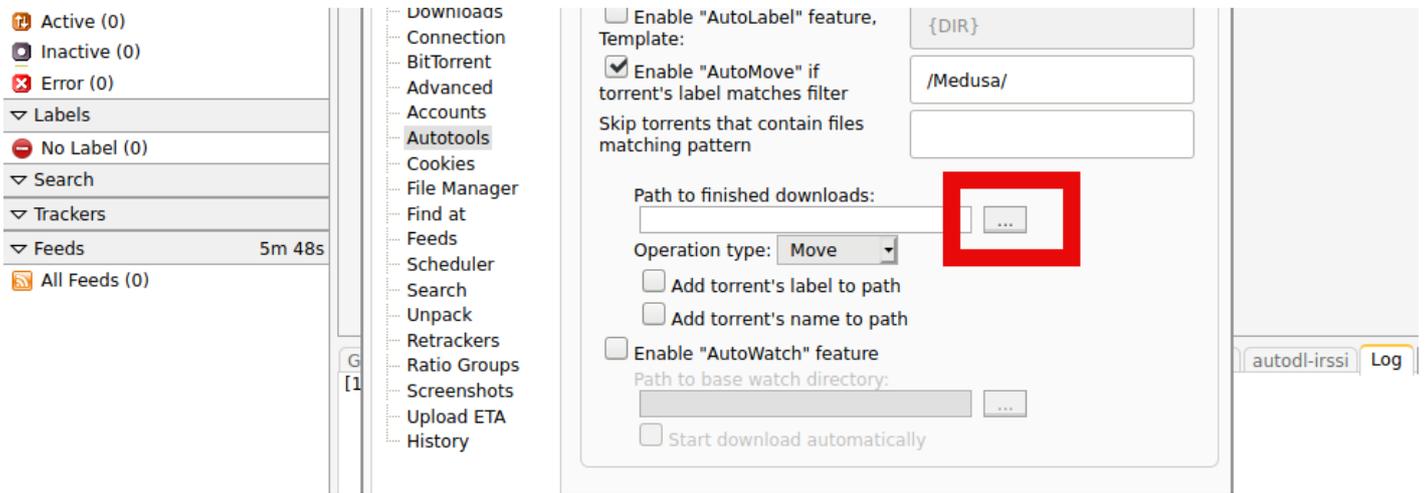

- Click on the **Autotools** section in left column

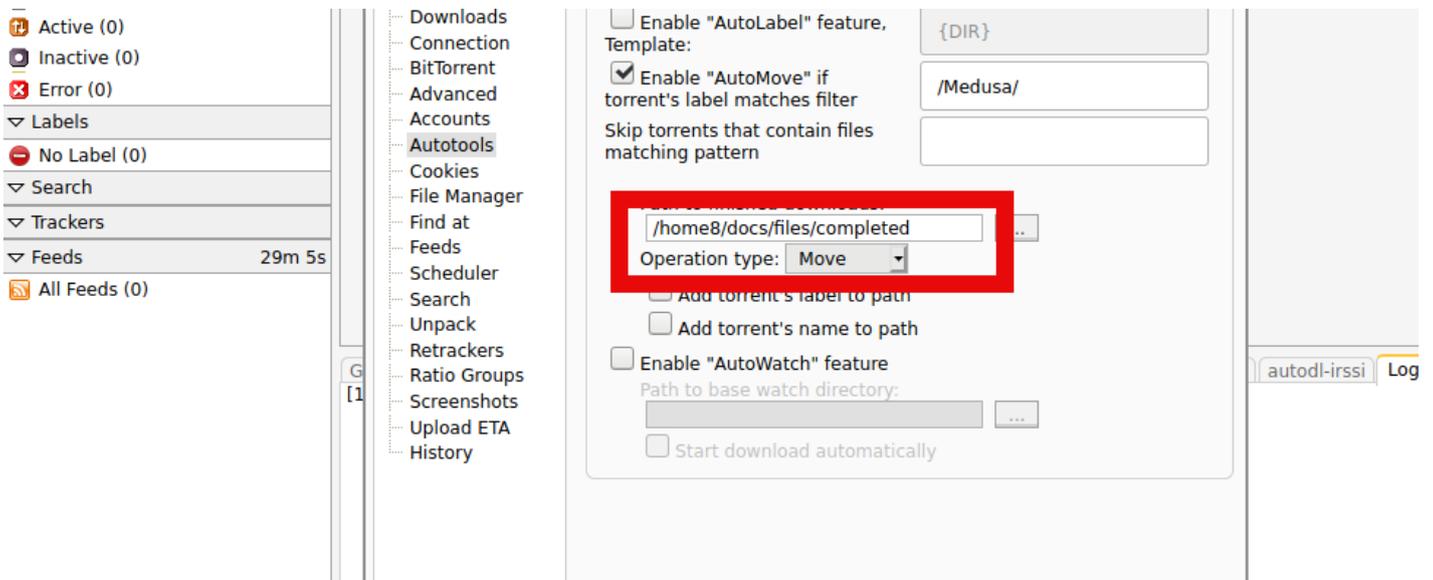

- Enable the checkbox that says: **Enable "Automove" if torrent's label matches filter** and change default entry `./` to `/Medusa/`

- Click the directory button next to **Path to finished downloads**

- Upon clicking the directory button, it will auto-fill the default download path your ruTorrent is using. This default location is: `{HOME##}/{USERNAME}/files`
  - Simply add: `/completed` to the end of the path, making the path: `{HOME##}/{USERNAME}/files/completed`
  - `{HOME##}` is your home number, in this example it is `'home8'`
  - `{USERNAME}` is your slot username, in this example it is `docs`

This step is very important if using ruTorrent as your download client. ruTorrent will not append an extension to downloads therefore Medusa's Post-Processor will import incomplete downloads if the Autotools-AutoMove plugin is not used in ruTorrent.

# Transmission

## Connection Settings

```

Search .torrent files: ENABLED
Send .torrent files to: Transmission
Transmission host:port: https://{username}.{servername}.usbx.me
Transmission RPC URL: transmission/rpc

```

Transmission Username: {username}

Transmission Password: As configured in UCP under Transmission

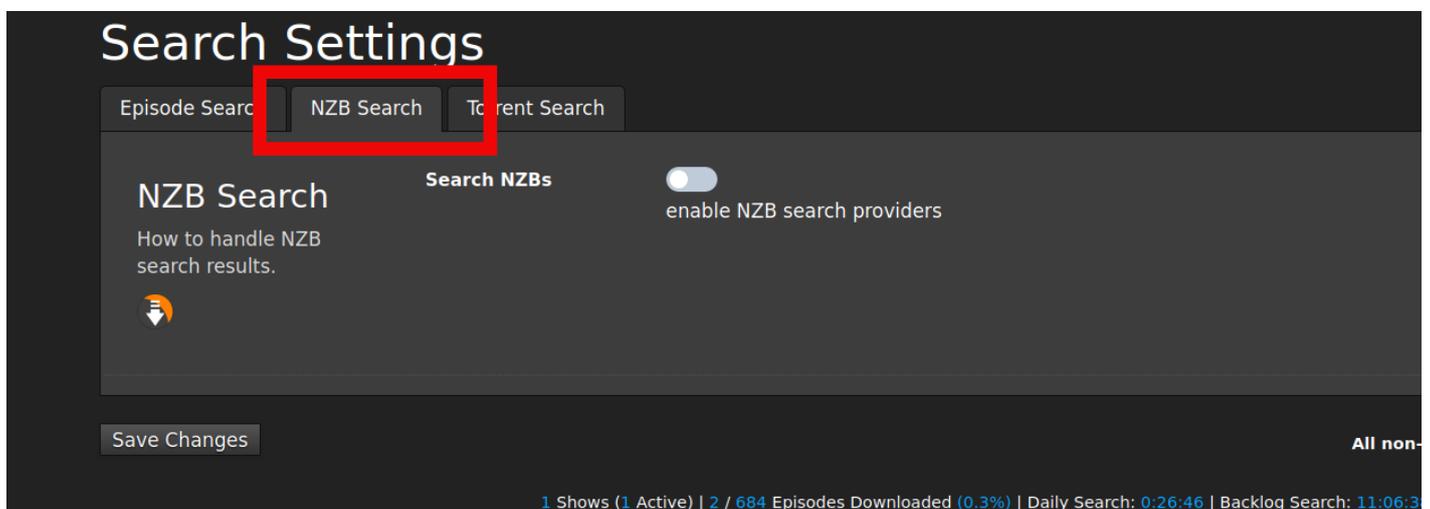

Downloaded Files Location: EMPTY

## Post Processing Setup

Transmission appends ".part" to the downloading file extensions until the download is completed and Medusa will ignore these files with ".part" extensions, so there is no need to configure any further **Post Processing** directory settings for this client

# Usenet Clients

- In **Search Settings**, to add a Usenet download client click on the **NZB Search** tab.

The screenshot shows the 'Search Settings' window with three tabs: 'Episode Search', 'NZB Search', and 'Torrent Search'. The 'NZB Search' tab is highlighted with a red box. Below the tabs, the 'NZB Search' section is visible, featuring a toggle switch for 'Search NZBs' which is currently turned on, and the text 'enable NZB search providers'. There is also a 'Save Changes' button at the bottom left. At the bottom right, there is a status bar with the text 'All non-' and a footer with system statistics: '1 Shows (1 Active) | 2 / 684 Episodes Downloaded (0.3%) | Daily Search: 0:26:46 | Backlog Search: 11:06:3'.

## NZBGet: Connection Settings

Search NZBs: ENABLED

Send .nzb files to: NZBGet

Host: {username}. {servername}. usbx. me/nzbget

Connect using HTTPS: ENABLED

Username: {nzbget username}

Password: {nzbget password}

Use NZBget category: Medusa

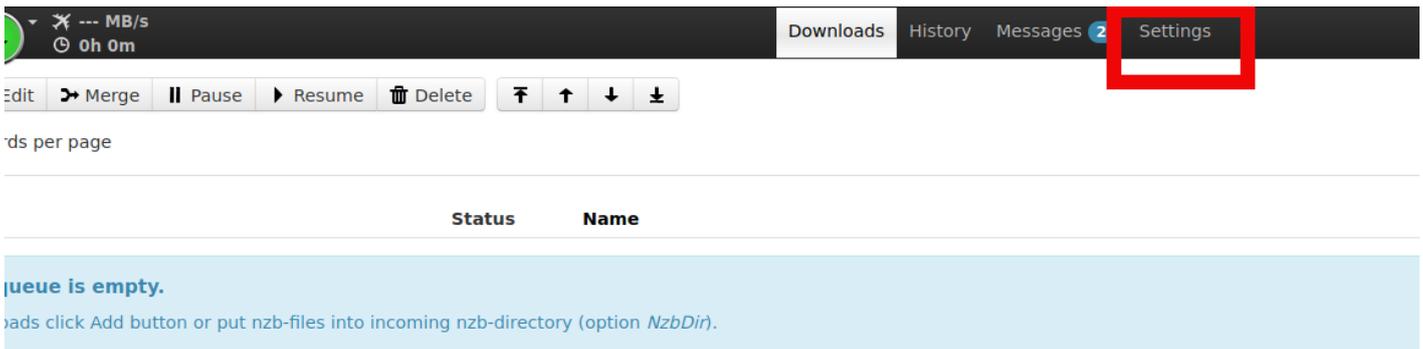

Use NZBget category (backlog episodes): Medusa

Use NZBget category for anime: Medusa-Anime

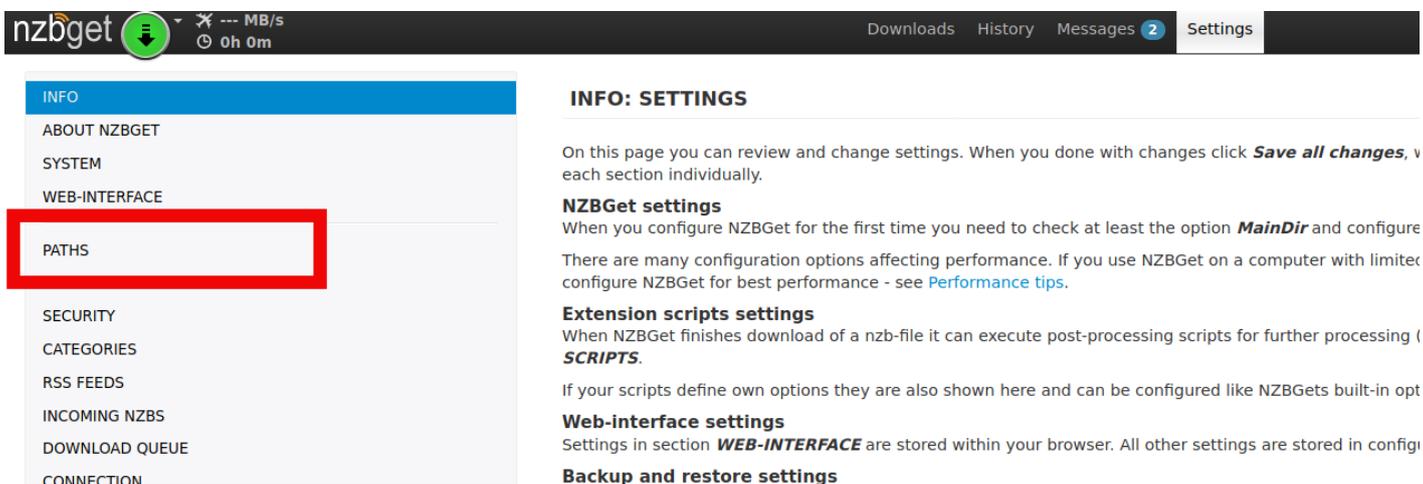

Use NZBget category for anime (backlog episodes): Medusa-Anime

## NZBGet: Post Processing Setup

- Access and login to your NZBget instance using the credentials you have set in the application.
- Go to **Settings** In the top right corner of the menu at the top of the initial login page.

- From here click on the **PATHS** link in the menu on left column menu

- Here you will see **MainDir** location default as `/downloads`

- **MainDir** needs to be the full path of the `files` directory in your home.
  - `{HOME#}/ {USERNAME}/files/`
  - To get the full directory of this folder, you can SSH into your slot and run the command: `readlink -f ~/files/`
  - The output of this command will give you the full path to your home's `files` directory
    - If you are unsure on how to SSH into your slot, you may refer to this guide: <https://docs.ultra.cc/books/secure-shell-%28ssh%29/page/how-to-connect-to-your->

## ultracc-slot-via-ssh

Per the example in the screenshot below, {HOME##} is **home8** and the {username} is **docs**, so the full path for the `files` directory would be: `/home8/docs/files`

The screenshot shows the nzbget web interface. The top navigation bar includes 'Downloads', 'History 1', 'Messages 85', and 'Settings'. The left sidebar has a menu with 'PATHS' selected. The main content area is titled 'PATHS' and contains two input fields: 'MainDir' with the value '/home8/docs/files' and 'DestDir' with the value '\${MainDir}/completed'. The 'MainDir' field is highlighted with a red box. Below the 'DestDir' field, there is a note: 'If you want to distinguish between partially downloaded files and comple...'. At the bottom of the page, there is a 'Save all changes' button highlighted with a red box and a 'Deluge' button.

- Scroll down to the bottom of the page to click **Save all changes** in lower left corner

The screenshot shows the 'CertStore' settings page. The 'CertStore' field contains the value '\$\${AppDir}/cacert.pem'. Below the field, there is a description: 'Certificate store contains root certificates used for server certificate verification with news-servers for article downloading and with web-servers (via https) for...'. There are two notes: 'NOTE: Certificate verification must be enabled separately via option CertChe...' and 'NOTE: For more details visit http://nzbget.net/certificate-verification.'.

A close-up of the 'Save all changes' button, which is highlighted with a red box.

Deluge

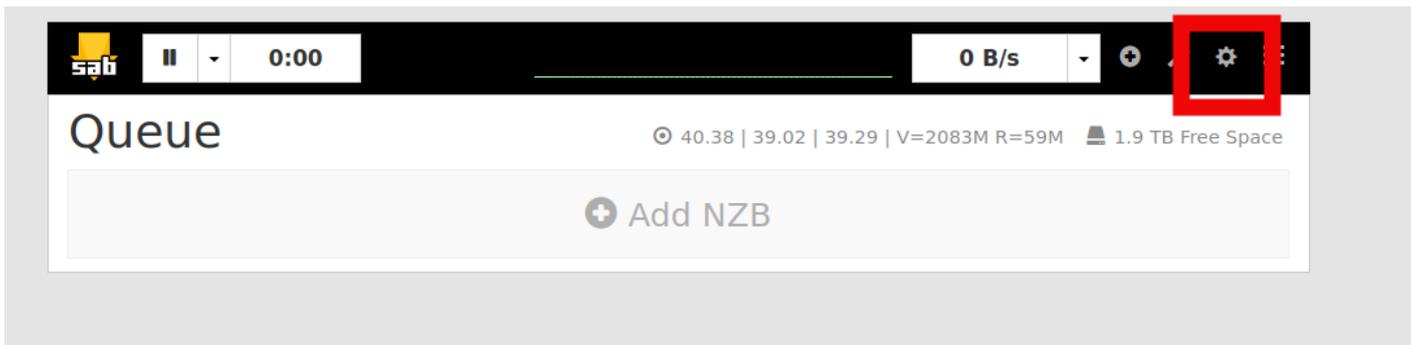

## SABnzbd: Connection Settings

The screenshot shows the SABnzbd Connection Settings page. The settings are listed as follows: Search NZBs: ENABLED, Send .nzb files to: SABnzbd, Host: {username}. {servername}. usbx. me/sabnzbd/, Username: {sabznbd username}, Password: {sabnzbd password}, SABnzbd : {sabnzbd api key}, Use SABnzbd category: Medusa, Use SABnzbd category (backlog episodes): Medusa, Use SABnzbd category for anime: Medusa-Anime, Use SABnzbd category for anime (backlog episodes): Medusa-Anime.

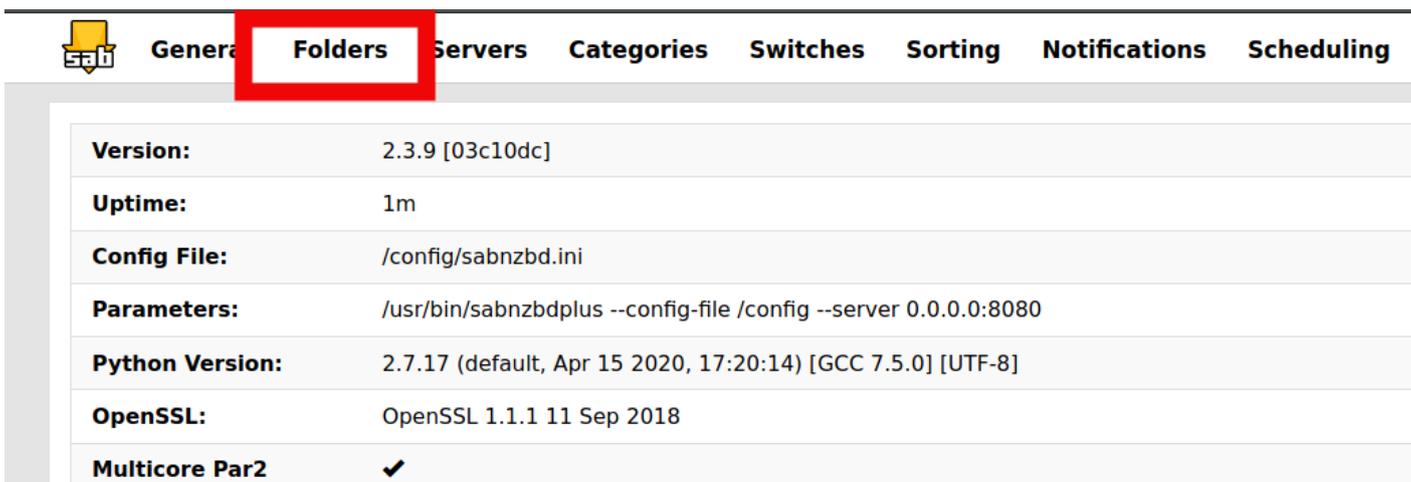

**\*\*It is important to have the trailing / on the end of your SABnzbd host, otherwise Medusa will fail to add NZBs successfully to this client.**

## SABnzbd: Post Processing Setup

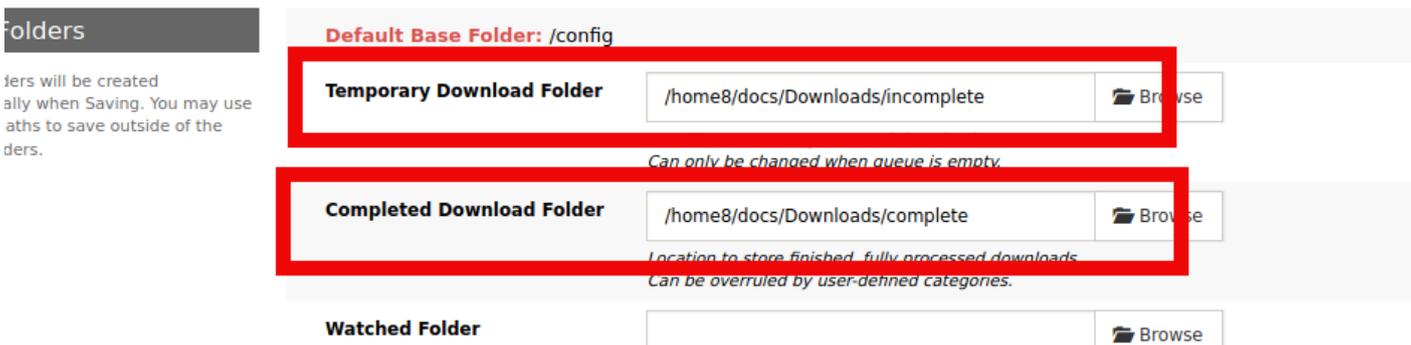

- Access and login to your SABnzbd instance using the credentials you have set in the application.
- Go to **Settings** In the top right corner of the menu at the top of the initial login page.

- Next, click the **Folders** link.

- From here you will see the 2 default directories that need to be changed
  - **Temporary Download Folder:** `{HOME}/Downloads/incomplete`
  - **Completed Download Folder:** `{HOME}/Downloads/complete`

- These 2 default directories need to be set to:
  - **Temporary Download Folder:** `{HOME}/incomplete`
  - **Completed Download Folder:** `{HOME}/files/completed`

## User Folders

*NOTE:* Folders will be created automatically when Saving. You may use absolute paths to save outside of the default folders.

**Default Base Folder:** /config

**Temporary Download Folder**

/home8/docs/incomplete

 Browse

*Location to store unprocessed downloads.*

*Can only be changed when queue is empty.*

**Completed Download Folder**

/home8/docs/files/completed

 Browse

*Location to store finished, fully processed downloads.*

*Can be overridden by user-defined categories.*
