

Setting Up megatools

megatools is a collection of programs for accessing and managing Mega.co.nz account from your terminal. It allows the following features:

- Copy individual files as well as entire directory trees to and from your account
- Perform streaming downloads without needing to download the entire file.
- Register your account using the `megatools reg` command, with the benefit of having proper control of your encryption keys.

In this short guide, we'll be showing you how to install/upgrade and uninstall megatools from your service, as well as a short description of the commands you can do on megatools.

Installing/Upgrading/Uninstalling megatools

- You can run the following command to install megatools into your service via [SSH](#):

```
bash <(wget -qO- https://scripts.ultra.cc/main/megatools/megatools-installer.sh)
```

megatools commands

- Listed below are the following commands of megatools.

```
megatools reg
[Register and verify a new mega account]

megatools df
[Show your cloud storage space usage/quota]

megatools ls
[List all remote files]

megatools test
[Test for existence of files or folders]

megatools export
[Create public links for remote files]

megatools mkdir
[Create remote directory]
```

megatools rm

☐ Remove remote file or directory

megatools put

☐ Upload individual files

megatools get

☐ Download individual files

megatools dl

☐ Download file from a "public" Mega link (doesn't require login)

megatools copy

☐ Upload or download a directory tree

- You can get the usage guide by running `megatools --help` options.
- You may also view the latest man pages here: [megatools\(1\)](#)
